Sequence 1, Application US/08528255A Patent No. 5659016 GENERAL INFORMATION:

APPLICANT: NAKAMURA, YUSUKE
APPLICANT: : FURUKAWA, YOICHI
TITLE OF INVENTION: RPDL PROTEIN
TITLE OF INVENTION: ENCODING THE

NUMBER OF SEQUENCES: 2
CORRESPONDENCE ADDRESS:

ADDRESSEE:

THIEL,

BOUTELL & TANIS,

P.C

```
GENERAL INFORMATION:
APPLICANT: Baldwin, Donald A.
APPLICANT: Baldwin, Steven P.
APPLICANT: Briggs, Steven P.
TITLE OF INVENTION: Maize Histone Deacetylases And
FILE REFERENCE: 5718-44,
CURRENT APPLICATION NUMBER: US/09/282,305
CURRENT FILING DATE: 1999-03-31
PRIOR APPLICATION UMBER: 60/080,563
PRIOR FILING DATE: 1998-04-03
                                                                                                             δÃ
                                                                                                                                                      밁

AAB67811 standard;

Protein; 501 AA

Methods for regulating gene expression in transgenic plants, e.g. repressing ethylene-responsive phenotypes (e.g. inhibition of hypocotyl elongation), comprises introducing genes encoding histone deacetylase CA2316036-A1. Histone deacetylase; AtRPD3A; RPD3; gene expression; transgenic plant; HDA1; ethylene-responsive phenotype; hypocotyl elongation. N-PSDB; Miki B, Arabidopsis thaliana Amino acid sequence of a histone deacetylase designated AtRPD3A. 29-JUN-2001 (first entry) AAB67811; (MIAC ) CANADA MIN AGRIC & AGRI-FOOD CANADA 24-AUG-2000; 2000CA-2316036. 27-FEB-2001. 2001-258457/27. The protein is homologous to yeast RPDJ and HDA1. The polynucleotide sequence is used in the method of the invention. The specification describes a method for regulating gene expression in transgenic plants. The method comprises modifying histones by introducing chimeric nucleotide sequences which have regulatory elements in operative association with a gene of interest or with a nucleotide sequence encoding histone deacetylase. The method is useful for regulating the developmental, physiological or blockemical pathway within a plant, particularly for repressing ethylener-responsive phenotypes (e.g. inhibition of hypocotyl elongation). The method is also useful as a functional test for identifying a phenotype associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method of suppressing the expression of a gene of interest by introducing into the cell a protein containing a DNA binding site and a chromatin inactivation portion, or a nucleotide encoding such a peptide. Preferably the chromatin inactivation portion is part of the histone deacetylation (HDAC) complex. The method can be used in disease treatment, for example in the treatment of cancer by the suppression of oncogenes, and in the production of disease models.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Suppressing expression of selected gene for treating cancer, involves introducing peptide comprising nucleic acid binding portion that binds to or associated with selected gene and chromatin inactivation portion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence

The present sequence is maize histone deacetylase encoded by HD cDNA belonging to family 1, ZmHD1. This enzyme responsible for removing acetyl modifications, may be localised to promoters targeted for repression by other proteins that associate with HD and specifically bind regulatory elements in promoter DNA. The HD nucleotide sequence can be used for producing transgenic plants with increased disease resistance. Additionally, compositions find use in screening for toxins that affect pathogenicity and in determining which disease response promoters are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Maize histone deacetylase; HD; HD cDNA; family 1, ZmHD1; gene repression: acetyl modification; promoter; regulatory element; transgenic plant; disease resistance; toxin screening; pathogenicity;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is that of a C-terminal portion of rice CC histone deacetylase 1 (HD1), a chromatin associated protein, as CC deduced from a cDNA contig (see AaZ58259) obtained from cDNA clones CC isolated from rice callus, 15-day-old leaf and 15-day-old seedling CC construction on the basis of homology to other plant histone CC deacetylases. The invention relates to isolated rice, soybean and CC wheat nucleic acid fragments encoding HD1. It also relates to the CC construction of a chimeric gene encoding all or a portion of HD1, CC in sense or antisense orientation, where expression of the chimeric CC gene results in production of altered levels of HD1 in a transformed host cell. The availability of nucleic acid sequences CC encoding (portions) of histone deacetylase proteins will facilitate Studies of global transcriptional regulation in eukaryotic cells, CC and will also provide mechanisms to control transcriptional gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is maize histone deacetylase encoded by HD cDNA belonging to family 1, ZmHD1. This enzyme responsible for removing acetyl modifications, may be localised to promoters targeted for repression by other proteins that associate with HD and specifically bind regulatory elements in promoter DNA. The HD nucleotide sequence can be used for producing transgenic plants with increased disease resistance. Additionally, compositions find use in screening for toxins that affect pathogenicity and in determining which disease response promoters are regulated by histone deacetylase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Maize histone deacetylase; HD; HD cDNA; family 1, ZmHD1; gene repression; acetyl modification; promoter; regulatory element; transgenic plant; disease resistance; toxin screening; pathogenicity; disease response promoter.

The protein is homologous to yeast RPD3 and HDA1. The polynucleotide sequence is used in the method of the invention. The specification describes a method for regulating gene expression in transgenic plants. The method comprises modifying histones by introducing chimeric nucleotide sequences which have regulatory elements in operative encoding histone deacetylase. The method is useful for regulating the developmental, physiological or biochemical pathway within a plant, particularly for repressing ethylene-responsive phenotypes (e.g. inhibition of hypocotyl elongation). The method is also useful as a functional test for identifying a phenotype associated with perturbing a gene. The histone deacetylase genes are useful for altering the development of an organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Methods for regulating gene expression in transgenic plants, e.g. repressing ethylene responsive phenotypes (e.g. inhibition of hypocotyl elongation), comprises introducing genes encoding histone deacetylase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents Arabidopsis thaliana histone deacetylase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          N-PSDB;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is maize histone deacetylase encoded by HD cDNA belonging to family 1, ZmHD1. This enzyme responsible for removing acetyl modifications, may be localised to promoters targeted for repression by other proteins that associate with HD and specifically bind regulatory elements in promoter DNA. The HD nucleotide sequence can be used for producing transgenic plants with increased disease resistance. Additionally, compositions find use in screening for toxins that affect pathogenicity and in determining which disease response promoters are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Maize histone deacetylase; HD; HD cDNA; family 1, ZmHD1; gene repression; acetyl modification; promoter; regulatory element; transgenic plant; disease resistance; toxin screening; pathogenicity;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 11
                                                                                           influencing cell cycle progression or to modulate gene transcription. The products can be used for diagnosis and therapy. They can be used, for example, to treat tumours or proliferative disorders or spermatogenesis, osteogenesis, chondrogenesis or the differentiation of progenitor cells. They can also be used to treat psoriasis, bone diseases, fibroproliferative disorders, degenerative disorders, or for repair of cartilage, increasing bone density, liver repair subsequent to a partial hepatectomy, to promote regeneration of lung tissue in the treatment of emphysema, or for inducing tolerance in autoimmune diseases, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated histone deacetylase polypeptide(s) and genes -develop products for modulating the proliferation, survival differentiation of cells, e.g. for treating tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Histone deacetylase gene: HDx; HDl; HDx polypeptide; H4; cell differentiation; chromatin structure; cell opposition of the proliferative disorder; fibroproliferative disorder;
                                   transplant recipients. HDx inhibitors can be used as anti-fungal a preservatives in foodstuff, feed supplements for promoting weight
                                                                                                                                                                                                                                                                                                                                                                                                                proteins are able to alter chromatin structure by deacetylating histones such as H3 or H4. They have the ability to modulate cell growth by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   polypeptide, designated HD1. The HDx polypeptides are capable of modulating proliferation survival and differentiation of cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a novel histone deacetylase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method of suppressing the expression a gene of interest by introducing into the cell a protein containing a DNA binding site and a chromatin inactivation portion, or a nucleotide encoding such a peptide. Preferably the chromatin inactivation portion part of the histone deacetylation (HDAC) complex. The method can be use in disease treatment, for example in the treatment of cancer by the suppression of oncogenes, and in the production of disease models.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides inhibitors of histone deacetylase enzymes such as HDAC-1, HDAC-2, HDAC-3, HDAC-4, HDAC-5, HDAC-6 and HDAC-D. These inhibitors may be antisense strands or they may be compounds identified by contacting the enzyme with the compound and measuring the resulting enzyme activity. These inhibitors are useful for treating cancers and for identifying which histone deacetylase is involved in a neoplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense oligonucleotide that inhibits expression of a histone deacetylase, useful for treating and/or alleviating the symptoms neoplasia, or for inhibiting neoplastic cell growth in an animal

The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular; vulnerary; gastrointestinal; nephrotropic; antiinfective; gynaecological; antibacterial; gene therapy; neural; immune; reproductive; renal; gastrointestinal; pulmonary; cardiovascular; proliferative disorder;

The RPDL gene is an important gene and has been found to be expressed in all the following human tissues: heart, kidney, liver, lung, pancreas, placenta, skeletal muscle, large intestine, peripheral leukocyte, ovary, prostate, small intestine, spleen, testis and thymus gland; but is not present in brain tissue. RPDL cDNA exhibits homology with the yeast transcription factor RPD3 and is believed to have a similar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       function. RPDL and DNA encoding it can be used in studying the interactions of the protein with DNA and other proteins in the cell.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
